## Introduction

In Sudoku the player fills entries of an incomplete Latin square subject to constraints. As a decision problem, it is NP-complete.

|  |  | 5 | 3 |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 8 |  |  |  |  |  |  | 2 |  |

| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 8 | 3 | 9 | 6 | 5 | 4 | 1 | 2 | 7 |
| 6 | 7 | 2 | 9 | 1 | 8 | 5 | 4 | 3 |
| 4 | 9 | 6 | 1 | 8 | 5 | 3 | 7 | 2 |
| 2 | 1 | 8 | 4 | 7 | 3 | 9 | 5 | 6 |
| 7 | 5 | 3 | 2 | 9 | 6 | 4 | 8 | 1 |
| 3 | 6 | 7 | 5 | 4 | 2 | 1 | 8 | 9 |
| 9 | 8 | 4 | 7 | 6 | 1 | 2 | 3 | 5 |
| 5 | 2 | 1 | 8 | 3 | 9 | 7 | 6 | 4 |

Some questions to ponder during this talk are:

- How can we solve large Sudoku puzzles? $\left(n^{2} \times n^{2}\right.$ instances)
- If any single entry is removed, how many distinct solutions can a puzzle have?
- Can such characteristics be used to better understand why algorithms work?

## Introduction

The Douglas-Rachford method (a projection algorithm) was originally introduced in connection with PDEs arising in heat conduction. Applied to convex problems, the methods have a strong theoretical foundation, and its behaviour well understood.

I will discuss recent applications of the Douglas-Rachford method to a number of NP-complete combinatorial optimisation problems which are far from convex. Despite a lack of sufficient theoretical justification, the method performs quite satisfactorily.

## A Variational Toolkit

Let $S \subseteq \mathbb{R}^{n}$. Recall, $S$ is convex if

$$
\lambda S+(1-\lambda) S \in S, \quad \forall \lambda \in[0,1] .
$$

The (nearest point) projection onto $S$ is the (set-valued) mapping,

$$
P_{S} x:=\underset{s \in S}{\operatorname{argmin}}\|s-x\| .
$$

The reflection w.r.t. $S$ is the (set-valued) mapping,

$$
R_{S}:=2 P_{S}-I .
$$

## The Douglas-Rachford Scheme

## Theorem (Douglas-Rachford, Lions-Mercier)

Suppose $A, B \subseteq \mathbb{R}^{n}$ are closed and convex with $A \cap B \neq \emptyset$. For any $x_{0} \in \mathbb{R}^{n}$ define

$$
x_{n+1}:=T x_{n} \text { where } T:=\frac{I+R_{B} R_{A}}{2} .
$$

Then $\left(x_{n}\right)$ converges to a point $x$ such that $P_{A} x \in A \cap B$.

$$
A=\left\{x \in \mathbb{R}^{n}:\|x\| \leq 1\right\}, \quad B=\left\{x \in \mathbb{R}^{n}:\langle a, x\rangle=b\right\} .
$$

## The Douglas-Rachford Scheme

## Theorem (Douglas-Rachford, Lions-Mercier)

Suppose $A, B \subseteq \mathbb{R}^{n}$ are closed and convex with $A \cap B \neq \emptyset$. For any $x_{0} \in \mathbb{R}^{n}$ define

$$
x_{n+1}:=T x_{n} \text { where } T:=\frac{I+R_{B} R_{A}}{2} .

## Modelling Sudoku: an NP-Complete Non-Convex Problem

Let $E=\left\{e_{j}: j=1, \ldots, 9\right\} \subset \mathbb{R}^{9}$ be the standard unit vectors. Define the array $X=\left(X_{i j k}\right) \in \mathbb{R}^{9 \times 9 \times 9}$ by

$$
X_{i j k}= \begin{cases}1 & \text { if } i j \text { th entry is } k, \\ 0 & \text { otherwise }\end{cases}
$$

| 7 |  |  |  |  | 9 |  | 5 |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | 1 |  |  |  |  |  | 3 |  |
|  |  | 2 | 3 |  |  | 7 |  |  |
|  |  | 4 | 5 |  |  |  | 7 |  |
| 8 |  |  |  |  |  | 2 |  |  |
|  |  |  |  |  | 6 | 4 |  |  |
|  | 9 |  |  | 1 |  |  |  |  |
|  | 8 |  |  | 6 |  |  |  |  |
|  |  | 5 | 4 |  |  |  |  | 7 |

## Modelling Sudoku: an NP-Complete Non-Convex Problem

Let $E=\left\{e_{j}: j=1, \ldots, 9\right\} \subset \mathbb{R}^{9}$ be the standard unit vectors. Define the array $X=\left(X_{i j k}\right) \in \mathbb{R}^{9 \times 9 \times 9}$ by

$$
X_{i j k}= \begin{cases}1 & \text { if } i j \text { th entry is } k \\ 0 & \text { otherwise }\end{cases}
$$

## Modelling Sudoku: an NP-Complete Non-Convex Problem

Let $E=\left\{e_{j}: j=1, \ldots, 9\right\} \subset \mathbb{R}^{9}$ be the standard unit vectors. Define the array $X=\left(X_{i j k}\right) \in \mathbb{R}^{9 \times 9 \times 9}$ by

$$
X_{i j k}= \begin{cases}1 & \text { if } i j \text { th entry is } k \\ 0 & \text { otherwise }\end{cases}
$$

## Modelling Sudoku: an NP-Complete Non-Convex Problem

Let $E=\left\{e_{j}: j=1, \ldots, 9\right\} \subset \mathbb{R}^{9}$ be the standard unit vectors. Define the array $X=\left(X_{i j k}\right) \in \mathbb{R}^{9 \times 9 \times 9}$ by

$$
X_{i j k}= \begin{cases}1 & \text { if } i j \text { th entry is } k, \\ 0 & \text { otherwise. }\end{cases}
$$

The constraints are:

$$
\begin{aligned}
& C_{1}=\left\{X: X_{i j} \in E\right\} \\
& C_{2}=\left\{X: X_{i k} \in E\right\} \\
& C_{3}=\left\{X: X_{j k} \in E\right\} \\
& C_{4}=\{X: \text { vec }(3 \times 3 \text { submatrix }) \in E\} \\
& C_{5}=\{X: X \text { matches original puzzle }\}
\end{aligned}
$$

A solution is any

$$
X \in \bigcap_{i=1}^{5} C_{i}
$$

## Modelling Sudoku: an NP-Complete Non-Convex Problem

$$
X \in \bigcap_{i=1}^{5} C_{i}
$$

## Modelling Sudoku: an NP-Complete Non-Convex Problem

$P_{C_{1}}, P_{C_{2}}, P_{C_{3}}, P_{C_{4}}$ are simple to compute since, for any $x \in \mathbb{R}^{9}$,

$$
P_{E} X=\left\{e_{j}: x_{j}=\max _{1 \leq i \leq 9} x_{i}\right\}
$$

$P_{C_{5}}$ is also simple and given by setting $A_{i j k}=1$ if the incomplete puzzle has a $k$ in the ijth position.

## Modelling Sudoku: an NP-Complete Non-Convex Problem

$P_{C_{1}}, P_{C_{2}}, P_{C_{3}}, P_{C_{4}}$ are simple to compute since, for any $x \in \mathbb{R}^{9}$,

$$
P_{E} X=\left\{e_{j}: x_{j}=\max _{1 \leq i \leq 9} x_{i}\right\}
$$

$P_{C_{5}}$ is also simple and given by setting $A_{i j k}=1$ if the incomplete puzzle has a $k$ in the ijth position.

Reformulate as a two set feasibility problem in the product space:

$$
x \in \bigcap_{i=1}^{5} C_{i} \subseteq \mathbb{R}^{9 \times 9 \times 9} \Longleftrightarrow(x, x, x, x, x) \in D \cap C \subseteq\left(\mathbb{R}^{9 \times 9 \times 9}\right)^{5},
$$

where

$$
D:=\left\{(x, x, x, x, x) \in\left(\mathbb{R}^{9 \times 9 \times 9}\right)^{5}: x \in \mathbb{R}^{9 \times 9 \times 9}\right\}, \quad C:=\prod_{i=1}^{5} C_{i}
$$

## Computational Details

We tested the Douglas-Rachford method ( $\mathrm{C}++$ ) on various large suites of Sudoku puzzles. We give details of the implementation.

- Initialise: $\mathbf{x}_{0}=\left(x_{0}, x_{0}, x_{0}, x_{0}, x_{0}\right)$ for random $x_{0} \in[0,1]^{9 \times 9 \times 9}$.
- Iterate: By setting

$$
\mathbf{x}_{n+1}=T \mathbf{x}_{n}=\frac{\mathbf{x}_{n}+R_{C} R_{D} \mathbf{x}_{n}}{2}
$$

- Terminate: Either, if a solution is found, or if 10000 iterations have been performed. Specifically, a solution is found if

$$
P_{D} \mathbf{x}_{n} \in C \cap D
$$

## Concluding Remarks

When presented with a combinatorial feasibility problem it is well worth seeing if the Douglas-Rachford method can deal with it. It is conceptually simple, and easy to implement.

Other successful non-convex applications include:

- Boolean satisfiability, protein folding, graph colouring.
- TetraVex, generalised 8-queens problem.
- Nonograms - a Japanese number painting
- Matrix completion. e.g. low rank, various Hadamard matrices.
- Any suggestions?
